

ACCORDING TO
INTERNATIONAL
ASSOCIATION FOR THE
STUDY OF PAIN (IASP),
**pain is a sensory and
emotional experience
associated with actual or
potential tissue damage**

IASP describes that pain is always a personal experience that is influenced to varying degrees by biological, emotional, psychological and social factors, sometimes life experience, and individual personalities too influences the pain experience

TYPES OF PAIN

Based on duration of pain³

Acute Pain Short-term and sharp

A normal response to an injury or medical condition.
It starts suddenly and is usually short-lived

Chronic Pain Long-lasting and recurrent

Continues beyond the time expected for healing.
It generally lasts for longer than 3 months

Based on the physiology and duration of action³

Mixed pain

No obvious cause

Nociceptive

Tissue damage related

Neuropathic

Nerve-damage related

BURDEN OF PAIN

According to the Global Pain Index, 93% survey participants suffered from body pain in the year 2019²

83%

Muscle ache

73%

Joint pain

61%

Tendon/ligament/
bone pain

49%

Pinched nerve

42%

Arthritis

35%

Rheumatism

38%

Osteoarthritis

Ensuring effective pain management is essential in enhancing the quality of life for individuals dealing with pain

Establishing the goals of treatment

- It is not always possible to achieve pain-free status, and this should be explained clearly to patients and their family
- A typical goal of treatment is to maintain or improve function

How we respond to drugs changes as we get older

Using a multi-disciplinary approach to pain management

Good pain management is finding a balance of therapies

Personalized Pain management: Patient-specific factors play a significant role in determining the most suitable medication and dosage regimen for pain management

There are several factors which influence the choice of medication for pain management -

Patient's pain intensity and type of pain

Age-related physiological changes

The severity and nature of pain experienced

Evaluation of the patient's medication profile is essential to identify potential drug interactions

Presence of underlying medical conditions

Considering concomitant medications is crucial in order to avoid unwanted interactions

HOLISTIC PAIN MANAGEMENT

ESTABLISHING THE NEED

WHAT IS HOLISTIC PAIN MANAGEMENT?

APPROACHES OF HOLISTIC PAIN MANAGEMENT

ADVANTAGES OF HOLISTIC PAIN MANAGEMENT

Multidisciplinary and holistic approach to manage pain by multimodal treatment modality results in improved outcomes (1/2)

BURDEN OF CHRONIC PAIN IS UNDERESTIMATED

Prevalence and societal burden of chronic pain are under-estimated, treatment is not always instituted and/or adequate¹

UNMET NEED

Unmet need in the treatment paradigm exacerbates the condition such that lifetime prevalence of suicide attempts in people with chronic pain ranges from 5%-14%²

ELDERLY AFFECTED

Treatment gap specifically has impacted the elderly with 68% of women and 38% of men aged 70 experiencing pain lasting ≥6 months³

MULTIDISCIPLINARY TEAM APPROACH

Optimal management of pain requires the structured and recognized education of pain specialists, pain medicine, and a holistic multidisciplinary team approach with appropriate behavioral therapy¹

Multidisciplinary and holistic approach to manage pain by multimodal treatment modality results in improved outcomes (2/2)

CLINICALLY EFFECTIVE AND COST EFFICIENT

Comprehensive multidisciplinary and holistic management utilizing a range of strategies and specialist treatments, has shown to be a clinically effective and cost-efficient alternative to usual care¹⁻⁴

GUIDELINES REQUIRED

Universal clinical guidelines and defined treatment pathways are required for the efficient management of chronic pain⁵

IMPROVED QUALITY OF LIFE

Benefits reported by patients extend not only to pain relief but also to improvements in physical functioning, quality of life, emotional distress, behavioral outcomes and self-esteem⁴⁻⁷

CONTINUUM OF PAIN

The characterization of pain as a temporal process, beginning with an acute stage, may progress to a chronic state of variable duration (1/2)

■ American Academy of Pain Medicine emphasizes:

There are no arbitrary buckets of “Acute Pain” and “Chronic pain”

Many chronic painful conditions start early after an injury or surgery

Some of the patients may be predisposed (or vulnerable) to developing chronic pain with even a simple acute injury

The characterization of pain as a temporal process, beginning with an acute stage, may progress to a chronic state of variable duration (2/2)

Multidisciplinary and holistic approach to manage pain by multimodal treatment modality results in improved outcomes

Change Pain Chronic Advisory Board meeting of pain specialists describe:

“Pain chronification” as the process of transient pain progressing into persistent pain

Pain processing changes as a result of an imbalance between pain amplification and pain inhibition

Genetic, environmental and biopsychosocial factors determine the risk, degree and time-course of chronification

Pain chronification - likely determinants that contribute to the risk of onset and maintenance of common chronic overlapping pain conditions (CPPCs) –

Physiological and genetic factors

Genetic variability and environmental events that determine an individual’s psychological profile and pain amplification status

Environmental contributions	High Physiological Distress	High State of Pain Amplification
<ul style="list-style-type: none">Physical traumaInfectionSmoking	Mood	Neuroendocrine function
Psychological stressors	Anxiety	Impaired Pain regulation
Cultural beliefs	Depression Stress response	Pro-inflammatory state
	Somatization	Autonomic function

Pain chronification - likely determinants that contribute to the risk of onset and maintenance of common chronic overlapping pain conditions (CPPCs) – Physiological and genetic factors

From the physiological perspective, an imbalance between enhanced ascending nociceptive inputs and inadequate inhibitory descending pathways

PHARMA- COLOGICAL WAYS TO MANAGE PAIN

Pharmacological methods of pain management - essential component of pain management strategies, should be used judiciously to achieve optimal pain relief while minimizing adverse effects

Classes of medications related to chronic pain management that offer better treatment decisions and combination therapy to manage different pain mechanisms

PARACETAMOL	NSAIDs	OPIOIDS	COMBINATION ANALGESICS	TOPICAL AGENTS
Analgesic and anti-pyretic effects	Anti-inflammatory, analgesic, and antipyretic effects	μ -opioid receptor agonists	Use of a number of drugs (analgesic or adjuvant) in combination to achieve the best pain relief in acute or chronic pain	Creams and patches that can be applied externally (for osteoarthritis of the knee or hand)
Favorable suitability profile	Block the COX enzymes that produce prostaglandins	Potent pain relievers -moderate to severe pain management	Different mechanisms of action allows modulating multiple transmission pathways	Avoids systemic side effects
Useful in managing mild to moderate pain	GI adverse events	Adverse effects: sedation, respiratory depression, and constipation	Topical NSAIDS Recommended with paracetamol knee OA	For mild to moderate neuropathic or osteoarthritic pain, either as an adjunct or as an alternative

Multimodal analgesia for pain management: The principle of multimodal analgesia is the use of number of drugs (analgesic or adjuvant) in combination to achieve the best pain relief in acute or chronic pain

Combining analgesics that act by different mechanisms of action allows modulating multiple transmission pathways and enables individual agents to act with potentially additive or synergistic effects¹

ESCEO	NICE	WHO	EULAR
<p>Topical NSAIDS recommended with paracetamol or SYSADOAs for knee OA when patients have insufficient pain relief^{2,3}</p> <hr/> <p>The combination of non-pharmacological and pharmacological intervention remains key to the management of knee OA and it is the basic principle in the ESCEO algorithm^{2,3}</p>	<p>NICE 2014 guideline for osteoarthritis recommended “Topical NSAID and/or paracetamol; can be used with paracetamol in knee and hand Osteoarthritis⁶</p> <hr/> <p>If the above medications are insufficient for pain relief, then consider adding opioid analgesics or substituting with (or in addition to paracetamol) an oral NSAID or COX 2 inhibitor⁶</p> <hr/> <p>Note: NICE 2022 do away with this recommendation citing that there is no strong evidence of benefit for paracetamol⁷</p>	<p>Paracetamol And/or NSAID e.g. ibuprofen, naproxen or celecoxib recommended for mild pain treatment⁵</p> <hr/> <p>For severe and persistent pain: potent opioids (morphine, methadone, etc.) with or without non-opioid analgesics (paracetamol), and with or without adjuvants⁵</p>	<p>NSAIDs may be used to relieve musculoskeletal signs and symptoms; local injections of glucocorticoids may be considered as adjunctive therapy</p>

NON- PHARMACOLOGICAL WAYS TO MANAGE PAIN

Non-pharmacological pain management (NPPM) is an intervention without the use of medications, complementary to medication treatments

The goals of non-pharmacological interventions are to decrease fear, distress and anxiety, and to reduce pain and provide patients with a sense of control.

CRYOTHERAPY	EXERCISE	ACUPUNCTURE	TRANSCUTANEOUS ELECTRIC NERVE STIMULATION (TENS)	COGNITIVE BEHAVIOUR THERAPY (CBT)
<p>Therapeutic cold: applied directly to an injured area to reduce hemorrhage and vasodilation</p> <hr/> <p>Decreases the local inflammatory response, edema production, and pain perception</p>	<p>Consists of passive movements, active exercises, stretching, and relaxation exercises</p> <hr/> <p>Gradual stretching and strengthening exercises</p> <hr/> <p>Patient education is mandatory about a therapeutic exercise regimen at home once therapeutic sessions have ceased</p>	<p>Depends on the use of thin metal needles that are inserted into specific body sites and stimulated manually or electrically</p> <hr/> <p>Considered an invasive procedure and needs a professional physician</p> <hr/> <p>Side effects - localized hyperemia, syncopal attacks, and hematoma</p>	<p>Involves the application of adhesive skin surface electrodes to the painful area</p> <hr/> <p>Has been used to manage acute and chronic pain - postoperative pain, complex regional pain syndrome</p> <hr/> <p>TENS has been shown to be effective in osteoarthritic and neuropathic pain</p>	<p>Treatment applies biopsychosocial approach to pain that targets behavioral and cognitive responses to pain</p> <hr/> <p>CBT protocols involve psychoeducation about pain, behavior, communication, and cognitive restructuring for distorted and maladaptive thoughts about pain</p>

Herbals are equitable pain relievers as NSAIDs, have synergistic effects, and are dose-sparing without severe side effects

NSAIDs:

Mainstay treatment for chronic pain¹
Uncertainty over safety & sustainability^{1,2}

MOA:

Interaction with pro inflammatory cytokines
IL-1a, IL-1b, IL-6 and TNF- α ²

HERBAL MEDICINES:

Many actives,
>1 MoA
Safer³

MOA:

inhibits inflammatory pathways like NSAIDs, also inhibits NF-kB²

HERBAL INTERACTIONS WITH INFLAMMATION MEDIATORS & CARTILAGE DESTRUCTION

rationale for treating OA complaints⁴

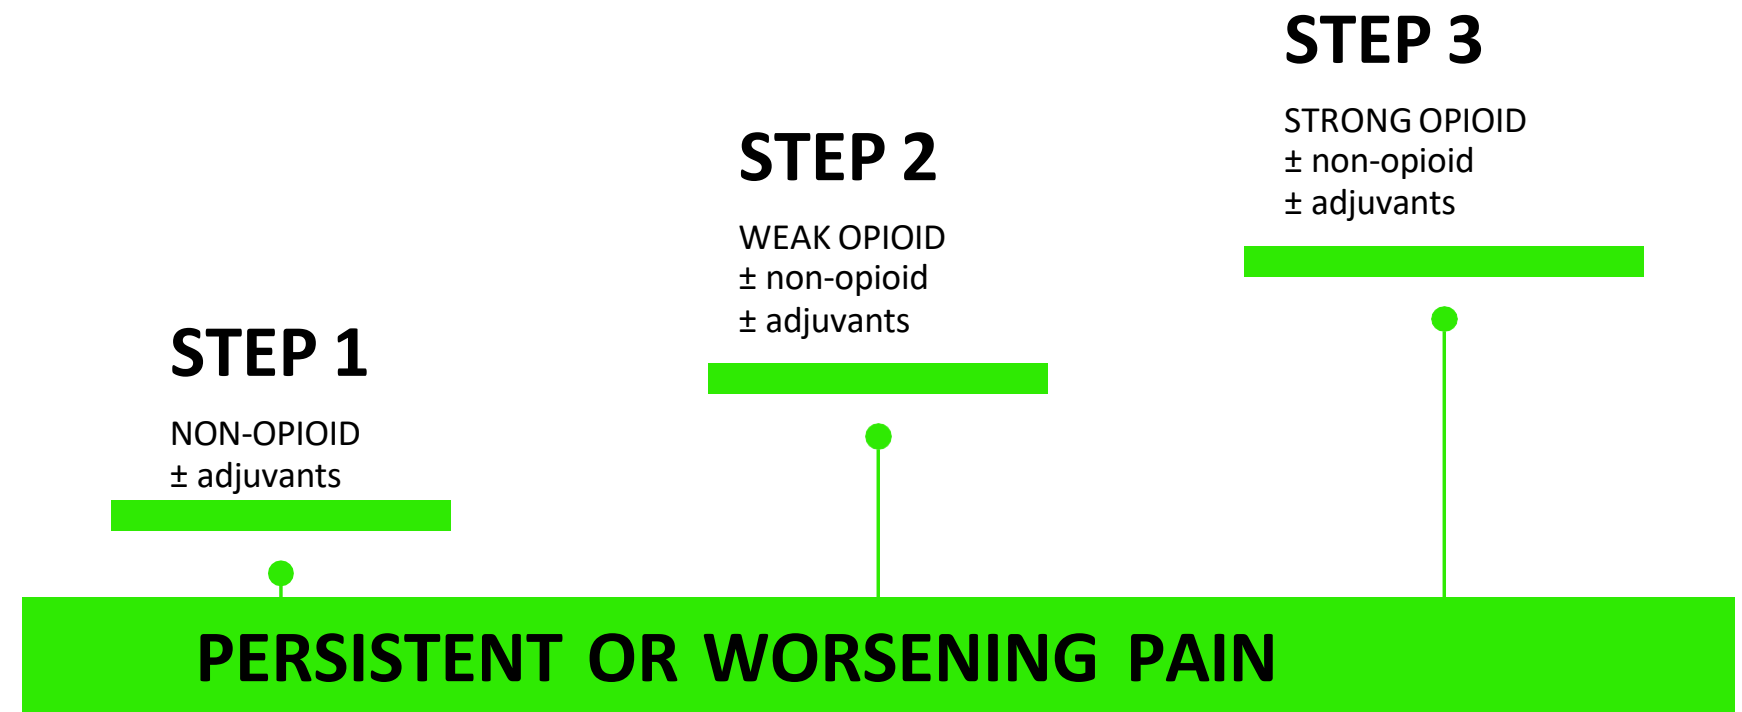

ROLE OF EXISTING ANALGESICS IN THE NEW OPIOID ERA

Pain management - the WHO Analgesic Ladder

The WHO analgesic ladder provides a general guide to pain management based on pain severity. However, it does not replace the need for individualised management based on careful assessment of an individual patient's pain

Opioid analgesic consumption shows alarming trends, particularly because of their potential for addiction, tolerance, and side effects¹

Patient education, non-opioids alternative and psychological treatments are recommended for management of chronic pain⁴

The Center for Disease Control and Prevention's guidelines 2016 recommends that only if the expected benefits for both pain and function outweigh the risks, clinicians should prescribe opioids at the lowest effective dose and for the shortest expected duration to treat the pain severe enough to require opioids²

When using opioids, it should be in combination with nonpharmacologic therapy and nonopioid pharmacologic therapy, as appropriate²

Choice of initial analgesic should take into account the cause and severity of pain

STEP 1

Start regular paracetamol

Dose reduction is advisable in many palliative care patients

And/or

NSAID *e.g. ibuprofen, naproxen or celecoxib*

Mild pain start at Step 1

STEP 2

If pain is persistent or worsening

Stop paracetamol if not helping pain

Start codeine
30-60 mg
four times
a day regularly

Moderate pain start at Step 2 or Step 3

STEP 3

On Maximum paracetamol and codeine, persistent or worsening pain

Stop paracetamol if not helping pain

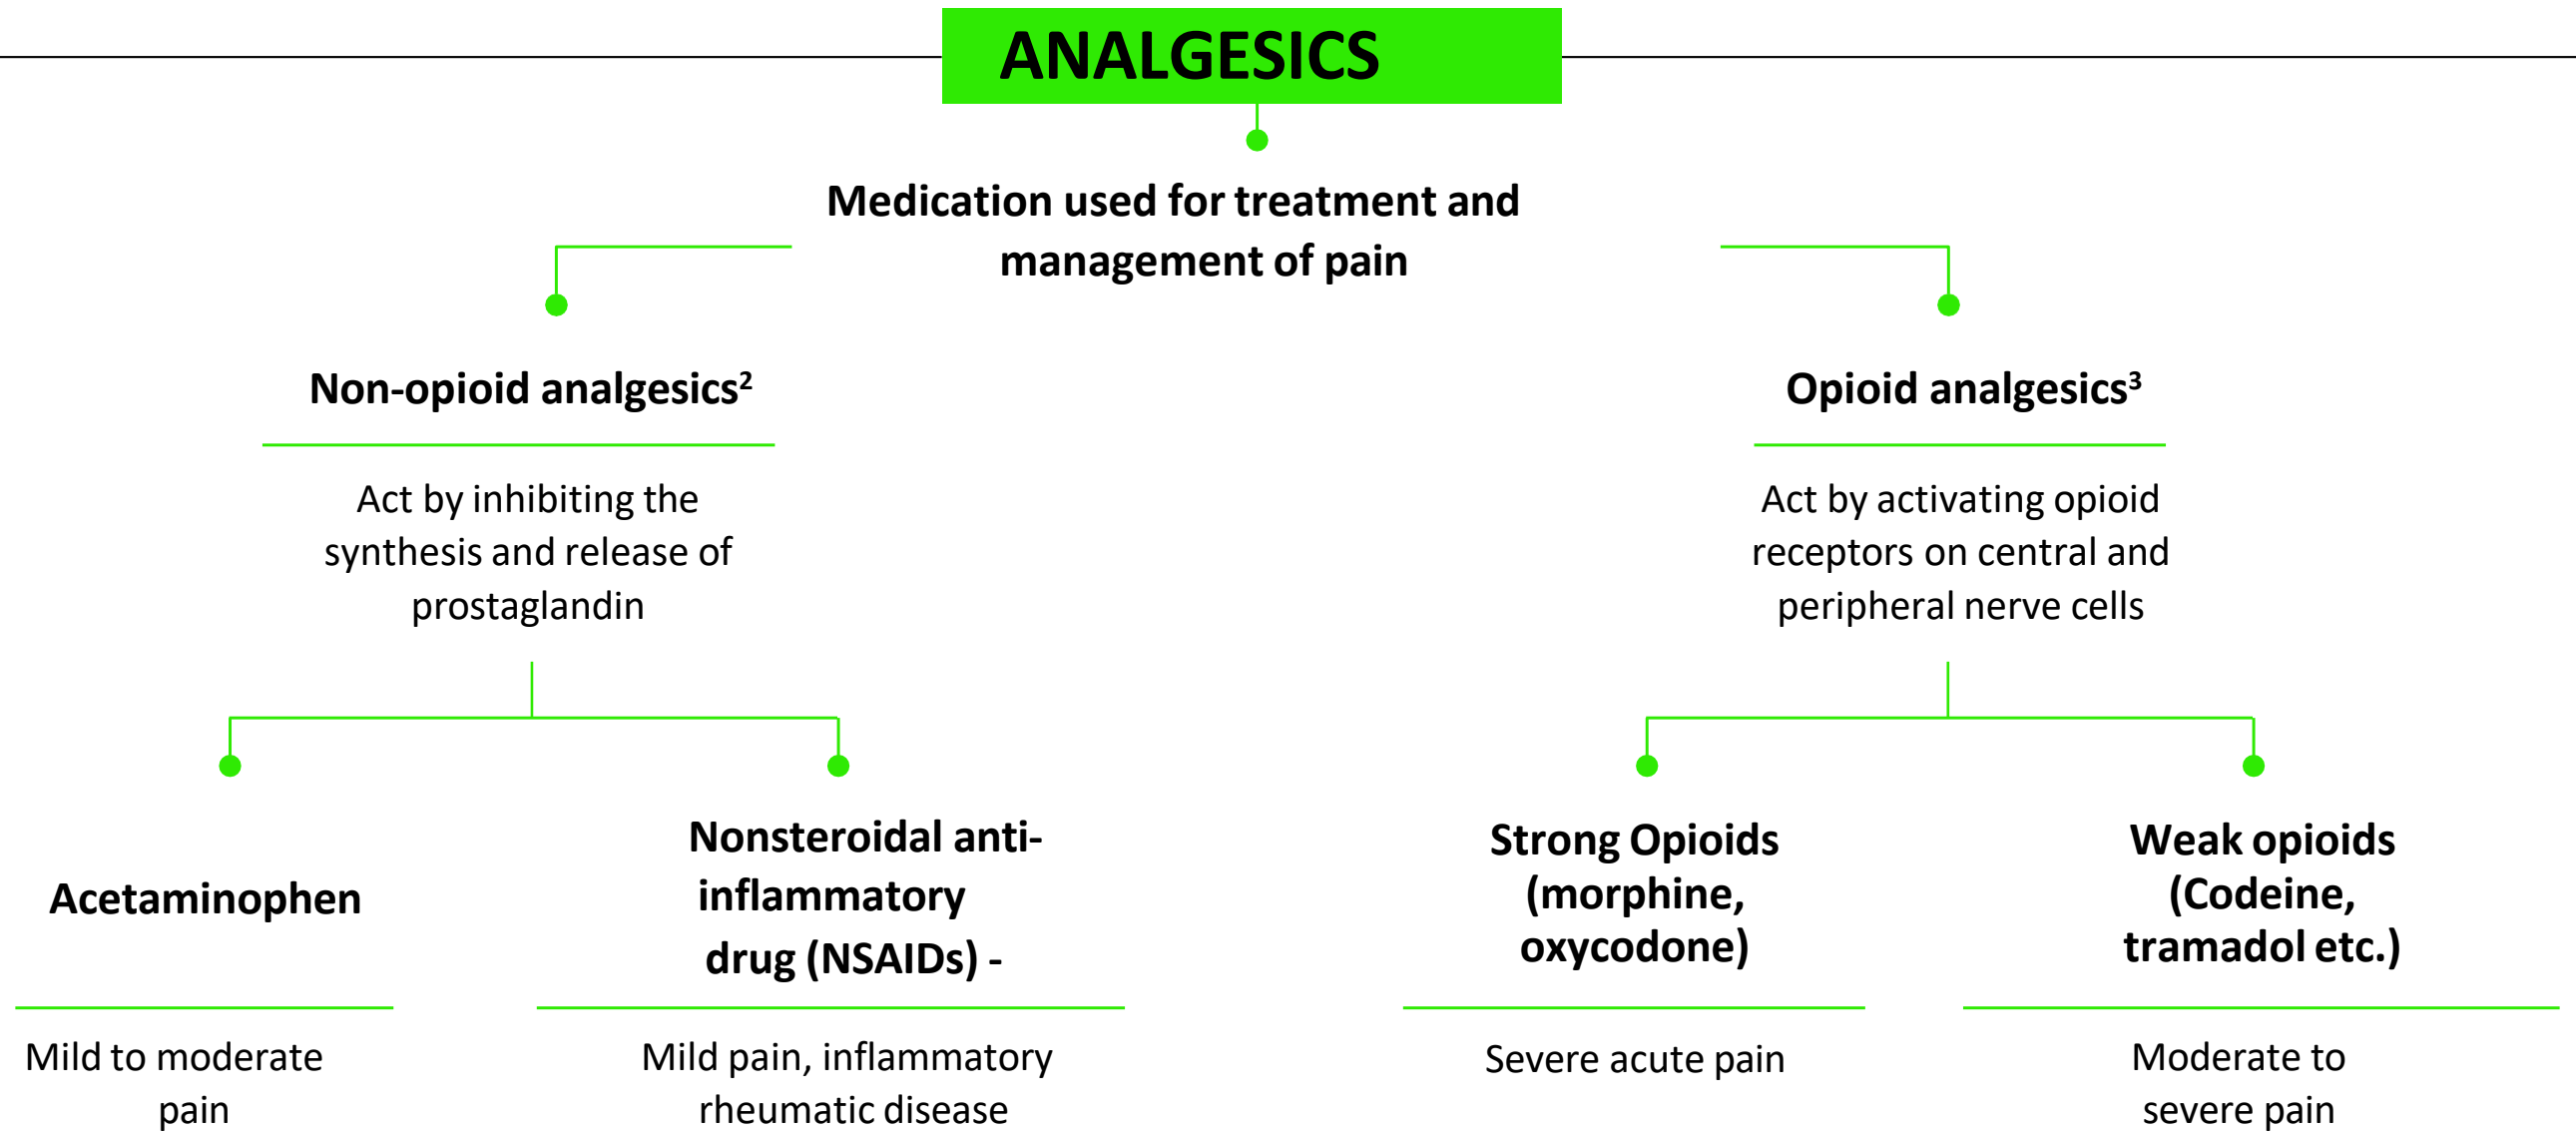

Stop codeine

Commence strong opioid
e.g. oral morphine

Severe pain, start at step 3

Choice of initial analgesic should take into account the cause and severity of pain

Preference of non-opioids over opioids for pain management

Long term use of opioid for chronic pain management can lead to physical dependence, respiratory depression, sedation, and mental clouding

PARAMETERS	OPIOIDS	NON-OPIOIDS ³
General recommendation ¹	Recommended when pain signals are too severe to be controlled by non-narcotic analgesics.	Effectively relieve mild to moderate headache and pain of musculoskeletal origin (Acetaminophen and NSAIDs) - Moderate to severe pain (combined with Opioid)
PREFERENCE OVER OPIOID ANALGESICS (e.g., chronic pain indication)		
Myofascial Pain Syndrome ⁵	—	+
Chronic low back pain, hip and knee osteoarthritis ⁴	—	+
Acute and chronic pain e.g., Low back pain ²	—	+
Chronic musculoskeletal pain (i.e. osteoarthritis) ²	—	+

2. Alternatives to Opioids for Managing Pain - StatPearls - NCBI Bookshelf (nih.gov).

3. Nonnarcotic Methods of Pain Management | New England Journal of Medicine (nejm.org).

4. Effect of Opioid vs Nonopioid Medications on Pain-Related Function in Patients With Chronic Back Pain or Hip or Knee Osteoarthritis Pain: The SPACE Randomized Clinical Trial | Pain Medicine | JAMA | JAMA Network.

5. Alternatives to Opioids in the Pharmacologic Management of Chronic Pain Syndromes: A Narrative Review of Randomized, Controlled, and Blinded Clinical Trials - PMC (nih.gov).

Combination Analgesics - Given the multiple pathways involved in the body's perception of pain, combination therapy is well suited for pain management

COMBINATION OF TWO ANALGESIC DRUGS HELPS TO:

Overcome tolerability, efficacy and time-to-onset limitations of the component drugs

Synergistically increase their analgesic effect

Dose sparing effect - allow for reduced doses of the component drugs, reducing overall adverse effects with comparable analgesia

Different mechanisms of action may also provide multimodal coverage of a broad spectrum of pain

Enable the individual agents potentially to act in a greater than additive (synergistic) fashion

GUIDELINE RECOMMENDATION:

Adding a NSAID to acetaminophen has been shown to improve efficacy in acute pain states

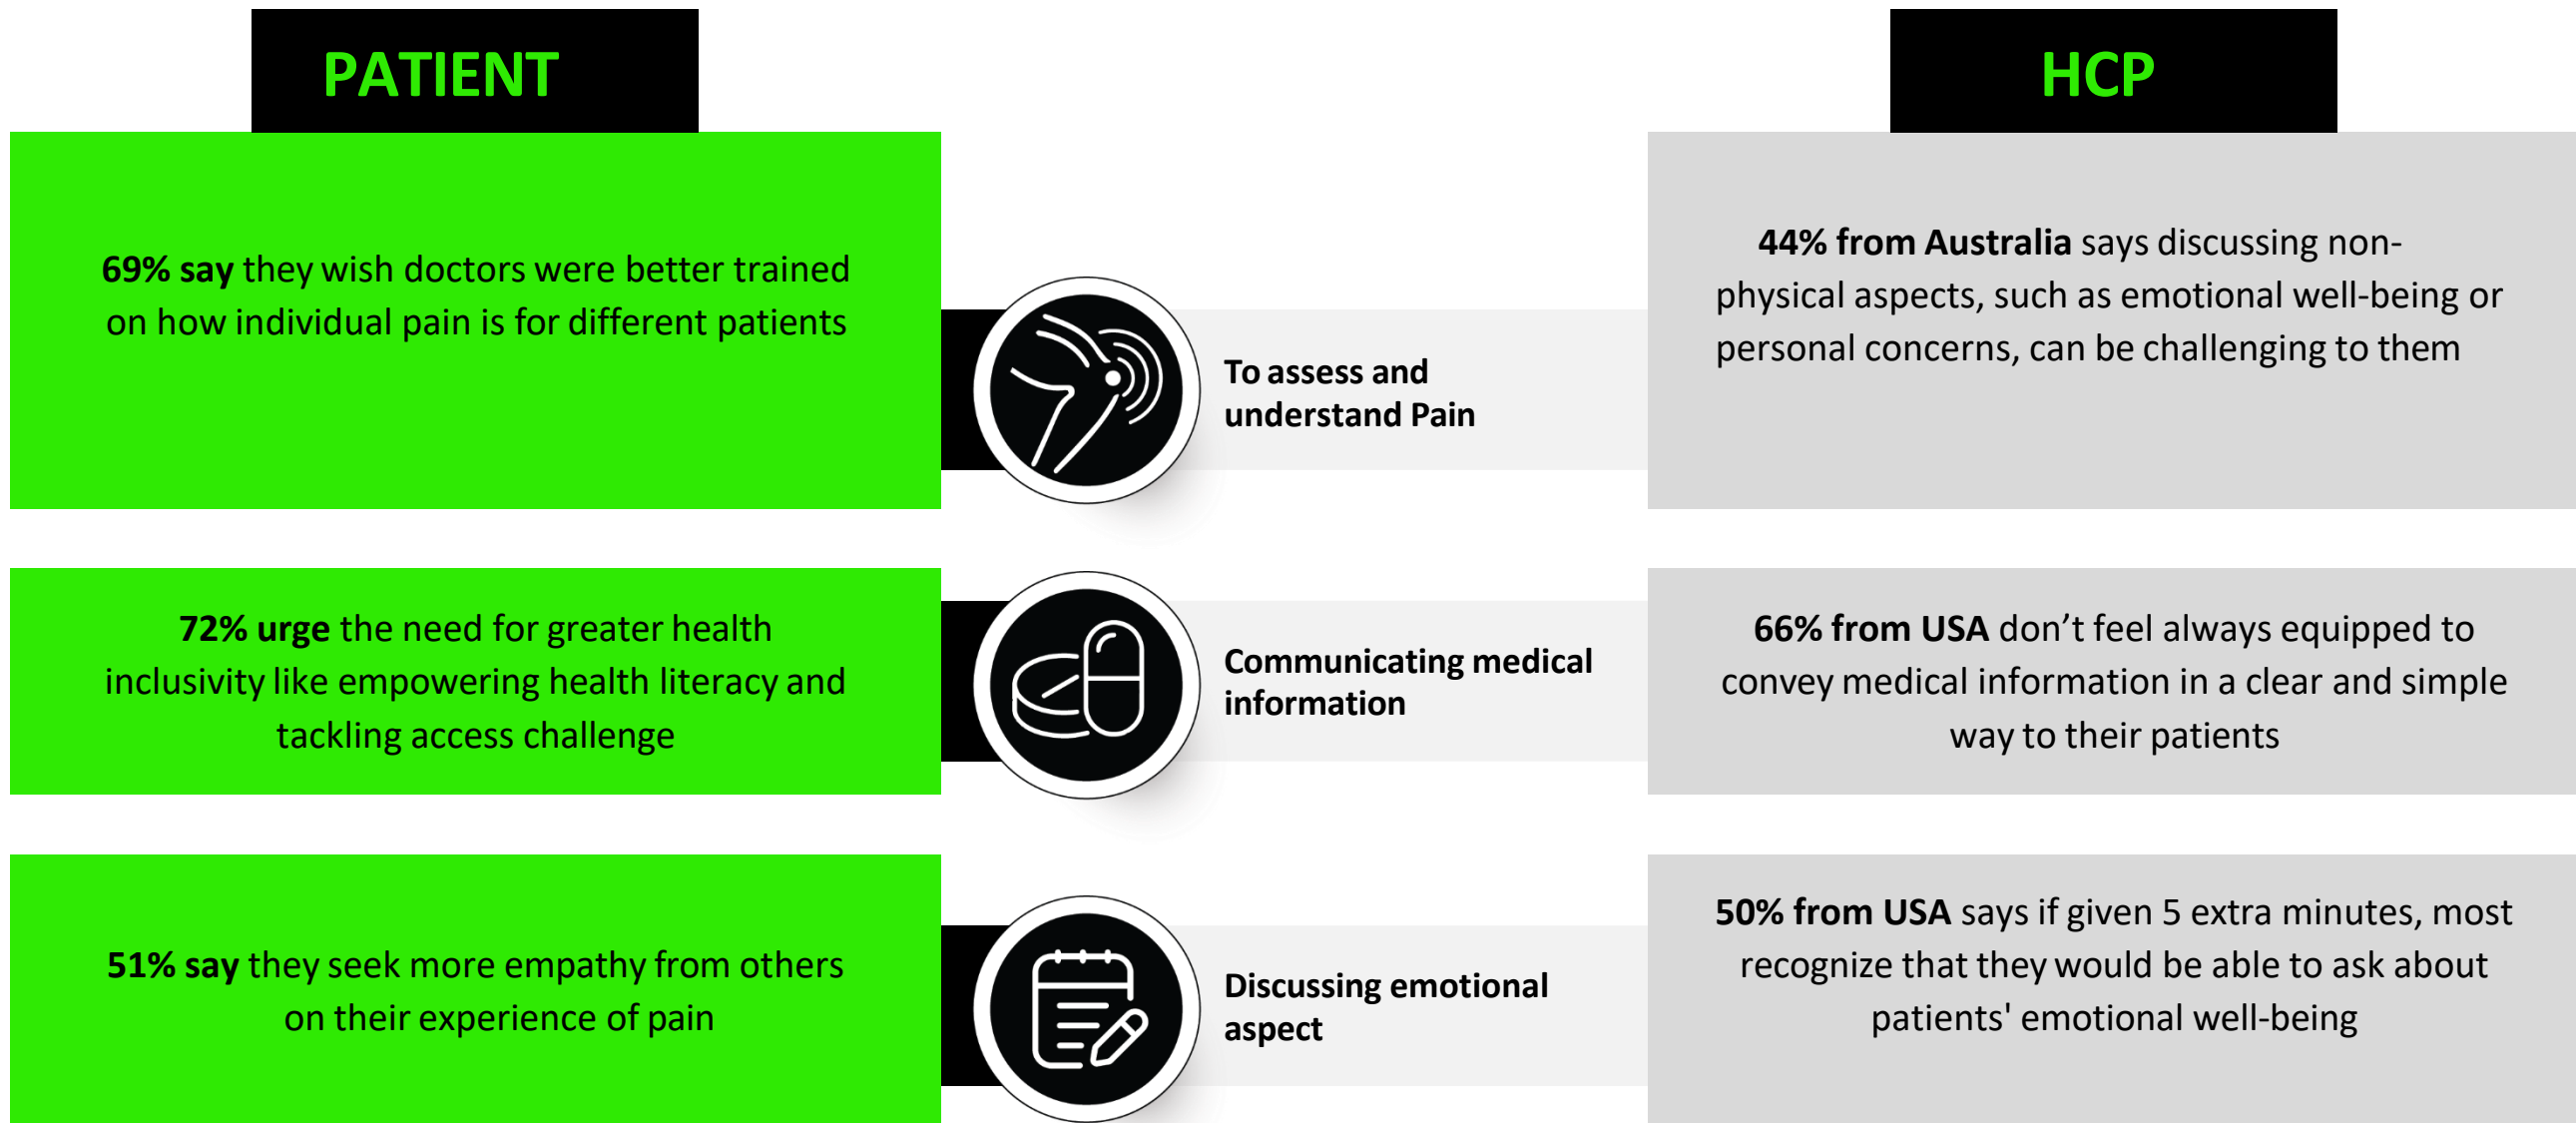

The American Geriatrics Society (AGS). American Medical Directors Association (AMDA) recommend combining analgesics for elderly patients and long-term care patients, respectively

The use of topical NSAIDs (the active ingredient in Voltaren® 12H) in conjunction with paracetamol (the active ingredient in Panadol®) is supported by international guidelines - ACR, NICE

ROLE OF HCPS IN HOLISTIC PAIN MANAGEMENT

Gaps between HCPs and patients on pain management

Source: 1. HPI Expert 2023 Study. 2. Haleon Global Pain Index (HPI 5), 2023.

Role of HCPs to help patient on holistic pain management

Knowing the gaps between HCPs and patients suggests the need of more personalized and compassionate view of pain:

- Considering emotional and loneliness aspects of person while assessing pain¹
- Discussing impact of pain on mental wellbeing, make patient feel heard and respected²
- Need to convey the complex medical information in clear and simple way to patient²
- Provide comprehensive care to chronic pain patients³
- Consider patient education about the use of painkillers and opioids
- Provide alternative treatment options/ holistic approaches to patients that can produce real results

Holistic assessment of pain includes social and emotional wellbeing

- Pain severity
- Other medication used
- Pain frequency
- Pain duration
- Previous treatments

- Lifestyle factors
- Impact of pain on daily activities
- Impact of pain on mobility
- Impact of pain on professional life

- Impact of pain on mental wellbeing
- Emotional impact of the pain

Note- Biopsychosocial model: Optimal care can only be provided through a combined team approach involving physicians, nurses, physical therapists, occupational therapists, psychologists, and social workers²

Source: 1. HPI Expert 2023 Study. 2. Haleon Global Pain Index (HPI 5), 2023. 3. Alternatives to Opioids for Managing Pain - StatPearls - NCBI Bookshelf (nih.gov).

HOLISTIC PAIN MANAGEMENT - KEY TAKEAWAYS

- IASP defines pain as a sensory and emotional experience associated with actual or potential tissue damage
-

- Patient-specific factors influencing personalized pain management include pain intensity, nature and type of pain, age-related physiological changes, underlying medical conditions, and patient's medication profile (including prescription of concomitant medications)
-

- Multidisciplinary and holistic pain management by multimodal treatment modality requires structured and recognized education of pain specialists, pain medicine, and a holistic multidisciplinary team approach with appropriate behavioral therapy

- Role of HCPs in holistic pain management includes individualized pain assessment, communicating complex medical information in a clear and simple manner to the patients, discussing with patients the impact of pain on their mental/emotional wellbeing, and considering both pharmacological and non-pharmacological/holistic approaches to pain management
-

- Incorporating a holistic approach to pain management is essential to achieve desired patient outcomes. Understanding the mechanisms of pain can provide a framework for a holistic approach to guide treatment decisions.
